Graded Assignment • 1h

Due Mar 13, 11:59 PM CET

Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 80%. We keep your highest score.

Next item →

1. What is the best definition of "Computer Programming" (as described by Andrew in this course)? 1 / 1 point

- ○ The act of using a computer to browse the internet.
- ◉ The process of creating instructions for computers to follow.
- ○ Designing physical components of a computer.
- ○ The study of how artificial intelligence works.

Correct
Yes! Programming involves writing detailed steps for a computer to execute

2. Which of the following lines of code will correctly display the words "Hello, world!" when run in a Jupyter notebook? 1 / 1 point

- ○ `print_out(Hello, World!)`
- ◉ `print("Hello, World!")`
- ○ `print_out("Hello, World!")`
- ○ `print(Hello, World!)`

Correct
Yes, that is the correct syntax to print `Hello, World!` in Python.

3. You are working with an AI Chatbot to help you write Python code. Which of the following **prompts** includes all the information needed to get the chatbot to write code to print the message `Hello, Alice!` to the screen? 1 / 1 point

- ◉ "Provide code to say hello to my friend in Python. My friend's name is Alice."
- ○ "Provide code to say hello to my friend in Python."
- ○ "Say hello to my friend."

Correct
Yes! You specified to the AI Chatbot what you want it to do, in which programming language you want it, and the name of your friend.

4. How many lines of code below **contain an error**? 1 / 1 point

```
print("Hello, my name is Andrew")
print(""I like wearing blue colored shirts")
print("I have two children"))
print("My favorite drink is Earl Grey tea.")
```

- ○ 1
- ○ There are no errors.
- ◉ 2
- ○ 3

Correct
Yes! There are 2 syntax errors present. (1) there are double quotes (") present in the second print statement. (2) in the third print statement, there's an extra parenthesis ("))

5. How would you modify the following python code to print both lines of code using a single print statement? 1 / 1 point

```
print("Hello, World!")
print("It's great to be here!")
```

Your code should still have the same output, with each sentence on a new line:

```
Hello, World!
It's great to be here!
```

- ◉ `print("""Hello, World!`
  `It's great to be here!""")`
- ○ `print(""Hello, World!`
  `It's great to be here!"")`
- ○ `print("Hello, World!`
  `It's great to be here!")`
- ○ `print("Hello, World!" "It's great to be here!")`

Correct
Yes, this is the correct way to do it.

6. Which of the following lines of code will create a **float** variable named **number**? 1 / 1 point

- ○ `number = "2.99"`
- ○ `2.99 = number`
- ○ `number = 299`
- ◉ `number = 2.99`

Correct
Yes, in this case number will be a float.

7. You are given the following Python code: 1 / 1 point

```
level = 5
```

What is the correct code for checking the **type** of the variable `level`?

- ○ `is_type(level)`
- ◉ `type(level)`
- ○ `typeof(level)`
- ○ `getType(level)`

Correct
Yes, this is correct.

8. Which of the following lines of code will correctly print the following sentence? (Select all that apply) 1 / 1 point

```
There are 600 seconds in 10 minutes
```

- ☐ `print(f"There are 10*60 seconds in 10 minutes")`
- ☑ `print("There are 600 seconds in 10 minutes")`

Correct
Yes, this will correctly print the sentence.

- ☑ `print(f"There are {10*60} seconds in 10 minutes")`

Correct
Yes, this will correctly print the sentence.

- ☐ `print("There are {600} seconds in 10 minutes")`

9. You want to store the number `1.61` as a variable called `miles_to_km` so that you can use it to convert distance from miles to kilometers. 1 / 1 point

Which of the following options is correct?

- ◉ `miles_to_km = 1.61`
- ○ `miles_to_km == 1.61`
- ○ `miles_to_km = "1.61"`
- ○ `miles_to_km : 1.61`

Correct
Yes, this is correct.

10. Which of the following lines of code will result in an error? 1 / 1 point

- ○ `type("There are 14,125 islands in Japan.")`
- ○ `print("There are 14,125 islands in Japan.")`
- ◉ `round("There are 14,125 islands in Japan.")`
- ○ `len("There are 14,125 islands in Japan.")`

Correct
In Python `round()` is a function that accepts a number and rounds it to the nearest whole number. A string is not a valid input to the `round()` function, so this will result in an error.
