← Back **Quiz 2**
Graded Assignment • 1h

Due Mar 20, 11:59 PM CET

Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 80%. We keep your highest score.

Next item →

1. You want to use a chatbot to write a birthday message for your friend **Mubsi**. You have stored the names of your friends in the following python list:

1 / 1 point

```
friends_list = ["Chris", "Mubsi", "Lucas"]
```

What should you insert between the curly braces in the following line of code to correctly identify **Mubsi** as the recipient of the message?

```
prompt = f"""
Write a four line get well soon card for my friend {},
"""
```

- `friends_list[1]`
- `friends_list(1)`
- `friends_list[2]`
- `friends_list(2)`

Correct
Yes! Since Python starts counting from zero (0), for Mubsi, the index needs to be `1`.

2. You run the following code in a Jupyter notebook cell:

1 / 1 point

```
colors = [
        "Blue",
        "Green",
        "Yellow",
        "Red"
]

for color in colors:
        prompt = f"""My favourite color is {color}"""
print(prompt)
```

What appears on the screen after you run the cell?

- My favourite color is Red
- My favourite color is Blue
  My favourite color is Green
  My favourite color is Yellow
  My favourite color is Red
- My favorite color is {color}
- My favourite color is Blue

Correct
Proper indentation is crucial when using `for` loops in Python. The lack of indentation before the `print` statement means it is not part of the `for` loop. Consequently, when Python executes the `print` statement, it uses the last value assigned to the `prompt` variable, which is "My favourite color is Red."

3. You are using a Python dictionary to store descriptions of vegetables. Here is the dictionary:

1 / 1 point

```
vegetable_descriptions = {
    "carrot": "Orange and crunchy",
    "potato": "Brown and starchy",
    "tomato": "Red and juicy",
     "onion": "White and pungent"
}
```

How would you print the description of a **carrot** to the screen?

- `print(vegetable_descriptions["carrot"])`
- `print(vegetable_descriptions[0])`
- `print(vegetable_descriptions[carrot])`
- `print(vegetable_descriptions("carrot"))`

Correct
This line of code accesses the description "value" associated with the `carrot` "key" in the dictionary and prints it.

4. Your friend Isabel just celebrated a birthday and now she is 30 years old. How will you update her **age** in the contact information dictionary below?

1 / 1 point

```
person_contact = {
    "name": "Isabel",
    "age": 29,
    "phone number": "+1-234-5678"
}
```

- `person_contact["age"] == 30`
- `person_contact.set("age", 30)`
- `person_contact["age"].set(30)`
- `person_contact["age"] = 30`

Correct
Yes! This directly assigns the new age "value" (30) to the "key" `age` in the `person_contact` dictionary.

5. You want to use an AI Chatbot to suggest you a recipe for making a fruit salad.

1 / 1 point

You create a python list to store the fruits you currently have sitting on your kitchen table:

```
fruit_list = ["apple", "orange", "banana"]
```

You then look in the refrigerator and find some grapes. Which of the following lines of Python code correctly add **grapes** to your list of fruits?

- `fruit_list.add("grapes")`
- `fruit_list.append("grapes")`
- `fruit_list.insert("grapes")`
- `fruit_list.push("grapes")`

Correct
The "append" method is used to add an item to the end of a list.
Here, `fruit_list.append("grape")` adds `grape` to the end of the `fruit_list`.

6. What text will appear on screen if you run the following code in a Jupyter notebook cell?

1 / 1 point

```
vegetarian = True

type(vegetarian)
```

- `int`
- NameError: name 'True' is not defined
- bool
- `str`

Correct
Booleans are a special data type in Python that indicate if a value is true or false. Booleans can be either True or False, and you must use the upper case first letter for the assignment to work correctly.

7. Given the following code, what will be the output?

1 / 1 point

```
age = 20

if age >= 18:
    print("Access granted")
else:
    print("Access denied")
```

- The code will result in a **Syntax Error**.
- This code will result in a **Type Error.**
- Access granted
- Access denied

Correct
This is correct because the condition `age >= 18` evaluates to `True`. Therefore, the `if` block executes, printing "Access granted".

8. Given the following code, what will be the output?

1 / 1 point

```
username = "admin"
password = "1234"

if username == "admin" or password == "admin123":
    print("Access granted")
else:
    print("Access denied")
```

- Access denied
- Access granted
- The code will result in a **Syntax Error**.
- This code will result in a **Type Error**

Correct
This is correct because the condition `username == "admin" or password == "admin123"` evaluates to `True`. The variable username is `"admin"`, which makes the first part of the condition `True`. In an `"or"` condition, if at least one part of the condition is `True`, the entire condition is `True`. Therefore, the code inside the `if` block executes, printing "Access granted".

9. You are a Manager at a Tech Startup. The deadline for delivering a project is fast approaching and you want to send an email reminder to your employees who have not yet completed their tasks. You have automated this process.

1 / 1 point

What code needs to be added in place of **### ADD MISSING CODE HERE ###** so that employees who have not completed their tasks are added to the **reminder_list**?

```
employees = [
    {
        "name": "Alice",
        "task_completed": True
    },
    {
        "name": "Bob",
        "task_completed": False
    },
    {
        "name": "Charlie",
        "task_completed": True
    },
    {
        "name": "Diana",
        "task_completed": False
    }
]

reminder_list = []
for employee in employees:
    ### ADD MISSING CODE HERE ###:
        reminder_list.append(employee["name"])

send_reminder_email(reminder_list)
```

- `if employee["task_completed"] = False:`
- `if employee["task_completed"] == True:`
- `if employee["task_completed"] == False:`
- `if employee["task_completed"] = True:`

Correct
This option is correct because this condition checks if the task is not completed (`task_completed` is `False`). This is exactly what we need to add employees who have not completed their tasks to the `reminder_list`.

10. Given this Python dictionary of fruits, where each category of fruit is a "key" of strings and fruits of that category and its description are "values" as a list, how will you print the description of **Blueberry** from the **fruit_descriptions** dictionary?

1 / 1 point

```
fruit_descriptions = {
  "Citrus": [
        {
            "name": "Orange",
            "description": "A juicy fruit that is rich in vitamin C, often
enjoyed as a snack or in juice form."
        },
        {
            "name": "Lemon",
            "description": "A tart fruit that is commonly used to add flavor to
dishes and drinks."
        }
  ],
  "Berries": [
        {
            "name": "Strawberry",
            "description": "A sweet, red fruit that is often used in desserts and
smoothies."
        },
        {
            "name": "Blueberry",
            "description": "A small, blue fruit that is packed with antioxidants
and often used in baking."
        }
  ],
  "Tropical": [
        {
            "name": "Mango",
            "description": "A sweet and juicy fruit with a unique flavor, often
enjoyed fresh or in smoothies."
        },
        {
            "name": "Pineapple",
             "description": "A tropical fruit with a tangy-sweet flavor, great
for eating fresh or adding to dishes."
        }
  ]
}
```

- `print(fruit_descriptions["Blueberry"])`
- `for fruit in fruit_descriptions["Tropical"]:`
  `  if fruit["name"] == "Blueberry":`
  `  print(fruit["description"])`
- `print(fruit_descriptions["Berries"]["Blueberry"]["description"])`
- `for fruit in fruit_descriptions["Berries"]:`
  `  if fruit["name"] == "Blueberry":`
  `  print(fruit["description"])`

Correct
Yes! This iterates through the list under the `Berries` "key", checks each fruit dictionary for the name `Blueberry`, and prints the corresponding description.
